c ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least ten 2'-C-methyl modifications; and (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis. The ENA's can also particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting calls of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for chanding graft tolerance or for treating autoimmume disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stromelysin whichout introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment concentration of ribozyme required to affect a therapeutic treatment specific. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                         ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Arthritic condition, graft tolerance, immune response, target, cleavage, hammerhead ribozyme, haltpin ribozyme, human, rabbit, mouse, collagenase, stromelysin, symovial membrane, joint, arthritis, osteoarthritis, rheumatoid arthritis; autoimmune disease, allergy, inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enzymatic nucleic acid molecules having a hammer-head motif - used for
                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention describes a novel enzymatic nucleic acid (ENA)
having a hammerhead motif (HM) comprising; (i) at least 5 ribose residues
; (ii) a 2'-C-allyl modification at position 4 of the ENA, (iii) at least
ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
can inhibit collagenase and stromelysin production in the synovial
can inhibit collagenase and stromelysin production of arthritis,
particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
be used to treat antigen presenting cells of a donor to induce tolerance
in a recipient to an alloantigen of a donor. They can also be used for
chancing graft tolerance or for treating autoinmune disease, and for
treating allergies and other inflammatory conditions. The ENA's can also
be used in diagnosis. Ribozyme therapy impacts on the expression of
stromelylysin without introducing the non-specific effects upon gene
expression which accompany treatment with retinoids and dexamethasone.
The concentration of ribozyme required to affect a therapeutic treatment
is lower than that required of antisense molecules, and is highly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò,

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 7; Page 53; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-Ike Growth Factor [16F]-1 receptor, 16F binding protein [16FBP]-2 or 16FBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hyperproliferation of the inside of blood vessels or any other hyperplasia 2X4X4FFFFXXXXCCCCCCCCCCCXXXXXXXXX

New enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-myb, for treating restenosis or cancer.

Claim 1; Page 77; 128pp; English.

Ξ

Ē

enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme, which did not form secondary folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty, and in cancers sequence represents the preferred target sequence for an Length 17; 0; Indels Sequence 17 BP; 6 A; 2 C; 6 G; 0 T; 3 U; 0 Other; Score 13; DB 1; Le Pred. Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and

The invention relates to a nucleic acid molecule which down regulates expression of a cD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (Mo20). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NGM with a NGM with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably MG^2+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more theory in particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphocytic leukaemia, and inflammatory arthropathy. The NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably Mg^2+. Furthermore, the coll and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more coll and treat a patient having a condition associated with the level of theraptes. In particular, the NOGO-targetting nucleic acid may be used to theraptes. In particular, muscular disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, and/or other neurodegenerative disease central respond to the modulation of NOGO expression. The present can an ambaryone molemie of the modulation of NOGO expression. The present sequence is an amberzyme molecule of the invention Claim 88; Page 131; 200pp; English. central nervous system injury.

```
The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates of the markers is changed so that the same discrimination Nos. succeed to plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified and the multimation Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell constituted as the positions on the chromosome and arrayed. The reconstituted as the positions on the chromosome and arrayed. The constituted as the positions and the chromosome and arrayed from the man chromosome and arrayed. The represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

```
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with nucleotides, or the complement, or corresponding RNA, of the nucleotides are used as probes or primers for detecting, dentifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour recombinant polypeptides, and to prepare transgenic animals, as crombinant polypeptides, and to prepare transgenic animals, as crombinant polypeptides, and to prepare transgenic animals, as calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment or relifications or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or solizophrenia).

Analysis of the expression of the nucleotides and polypeptides can and/or prognosis of these diseases. The nucleotides and polypeptides can be used to screen for their specific interactive molecules, expression of the nucleotides associated with abnormal expression of the nucleotides associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human; cardiant; antiarteriosclerotic; hypotensive; immunosuppressive; dermatological; anorectic; cytostatic; antidiabetic; haemostatic; anti-HIV; antiasthmatic; antibacterial; virucide; neuroprotective; nootropic; antiparkinsonian; antilipaemic; gene therapy; vaccine; PCR;

```

The invention relates to a novel (NOVX) human polypeptide. A polypeptide of the invention has cardiant, antiarteriosclerotic, hypotensive, immunosuppressive, dermatological, anorectic, cytostatic, antidiabetic, had made an antiasthmatic, antibacterial, virucide, neuroprotective, nootropic, antiparkinsonian, and antilipaemic activity. A polymucleotide encoding a polypeptide of the invention may have a use in gene therapy, and as a vaccine. A polypeptide of the invention is useful in the manufacture of a medicament for treating a syndrome associated with a human disease, the disease selected from a pathology reacting or preventing NOVX associated may also be used in diagnosing, treating or preventing NOVX associated disorders such as cardiomyopathy, atherosclerosis, hypertension, scleroderma, obesity, cancer, diabetes, natherosclerosis, infections, anorexia, cancer-associated cachexia, neurodegenerative disorders (e.g. Alzhaimer's disease or Parkinson's disease), hemmatopoletic disorders, dyslipidamias and other wasting disorders associated with chronic diseases. The nucleic acids are also used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The polypeptides are also useful as vaccines. The presents a PCR primer used in the invention.

```
reassortant influenza A viruses comprising atleast one genome segment of such an equine influenza virus, wherein the equine influenza virus genome segment confers atleast one identifying phenotype of the cold-adapted equine influenza virus, such as cold adaptation, temperature sensitivity, dominant interference or attenuation. The viruses are useful for protecting animals from diseases caused by influenza viruses. They are also used as vaccines. The present sequence is a PCR primer which is used to amplify equine influenza viral genome
                                                                                                                                                                                                                                                                                                                                                                                                                    proteins and viruses containing nucleic acid molecules encoding the proteins, which are useful for protecting animals from influenza virus
                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated equine influenza virus (wild-type and cold-adapted)
                                                   influenza virus; cold adaptation; temperature sensitivity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses cold-adapted equine influenza viruses and
               PCR primer #20, used to amplify equine influenza viral genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 18 BP; 4 A; 5 C; 5 G; 4 T; 0 U; 0 Other;

Sequences shown in AAV55812 to AAV55827 represent primers used in the course of the invention for the multimerisation of minimal motifs. The course of the invention for the multimerisation of minimal motifs. The course of the invention provides a method for increasing the resistance of a core protein to protein a stabilising polypeptide of formula onto or into the core protein a stabilising polypeptide of formula (Gigha) X(Glyb) Y(Glyc) Zln where Glya, Glyb, Glyc are 1-6 sequential Glyc residues and X, Y, Z are Ala, Ser, Val, Ile, Edw, Met, Phe, Pro or Throw on non-be anything between 1-66. X, Y and Z need not be identical from the near be anything between 1-66. X, Y and Z need not be identical from the polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to core protein. The products can be used for treating autoimmune diseases, cancer and inflammation. In particular, the core protein may be considered to a nitroreductase protein for the treatment of inflammatory bowel calsease, or a nitroreductase protein which can activate nitro drugs in enzyme/product therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in diagnostic methods such as in
core protein with a stabilising polypeptide comprising a peptide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Xylanase, acidophilic, thermostable, XYL I; XYL II; plant biomass, hemicellulase, beta-1,4 bond, xylosic chain, xylan, D-xylose, paper; pulp; chlorine bleaching; feed; beta-glucan; cellulose; lignin; ds.

                                                                                                                                 Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                            The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TMPR1), where the antisense compound inhibits expression of TMPR1. The antisense compound is useful for inhibiting the expression of TMPR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TMPR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TMPR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pusion protein, stabilising polypeptide, proteolytic degradation, resistance, half-life, autoimmune disease; inflammation, nitro drug; IkappaB regulator protein; inflammatory bowel disease; in vivo imaging; nitroreductase protein; enzyme therapy; prodrug therapy; protease; cancer; pathological condition; minimal motif; PCR primer; ss.

This invention describes the use of novel acidophilic and thermostable xylanase enzymes (XYL I and XYL II) from Actinomadura sp. FC7 which cretain their activity under harsh industrial conditions (e.g. high temperature or wide pH ranges) and may be secreted by recombinant host cells, to treat plant biomass. Xylanases XYL I and XYL II are part of a large group of hemicellulase enzymes and function by cutting the beta-1,4 bonds within the xylosic chain of xylan (a polymer of D-xylose residues that is a major constituent of hemicellulose). This means that they may be used in the paper and pulp industry to improve the efficiency of the bleaching process by degrading the structure of the material. XYL I and XYL II may also be used to treat feed, by degrading a substrate with a conditions which tend to denature most known xylanases. Enzymes that conditions which tend to denature most known xylanases. Enzymes that activity at high temperatures (e.g. 70 deg. C) and at low pHz ospeed up other, conditions which tend to denature most known xylanases. Enzymes that are carried out at high temperature and low pHz ospeed up other, one-enzymatic reactions, minimising costs, energy requirements, and the calcilitate chloraine bleaching of paper pulp which is carried out in hot, acidic conditions). Pretreatment with XYL II and XYL II allows the colouration from it. This means smaller quantities of the agents can be used to produce the same or a better result. Also, disrupting the structure aids water drainage. NOTE: This patent is an equivalent to F19503640. (Updated on 25-MAR-2003 to correct DR field.)

            The present invention describes a method for distinguishing a human leukcoyte antigen (HLA) class I antigen or allele by a combination of polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B or -C alleles can be amplified or using reverse hybridisation analysis comprising a DNA probe covalently bonded to microtitre plate wells which are hybridisable specifically with the base sequence of at least one specific HLA-A, -B or -C allele. The method is applicable in gene typing, judging donor-recipient compatibility during organ transplant and correlation analysis for diagnosis of various diseases. The method is simple, rapid and accurate, with possibility of mechanisation and automation, without the problems encountered by using the prior-art techniques. ```
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the uncleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. ```
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant sejection and alleviating symptoms in patients with rheumatoid arthritis, correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mcswiggen JA;

RESULT 387

Rattus rattus

schultz451-1.rng

nucleotide base position indicated in the DE line. Regions of the mRNA hath do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatcid arthritis, correct PI field.)

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a growth factor (VEGF). A patient fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                Vascular endothelial growth factor receptor; VEGF receptor; fit-1; fik-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                  Mouse flk-1 VBGF receptor hammerhead ribozyme substrate #666.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Escobedo J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Stinchcomb D,

```

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the

Ribozymes having modified bases and methods for producing them - for use in inhibiting disease related genes.

WPI; 1995-351090/45.

                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (BER-R) gene. AAV9721 to AAV98043 and AAV98979 to AAV99090 represent specifically claimed target sequence from human BGF-R. AAV98044 to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human BGF-R. The NAMs are useful for claving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleic acids - which cleave RNA derived from an epidermal actor receptor, useful for inhibiting cell proliferation and for

A humanised anti-HM1.24 antibody has been developed which comprises human L and H chain C regions, and L and/or H chain V regions containing material originating in mouse anti-HM1.24 antibody. The V regions containing framework (FR) regions of human origin and complimentarity determining regions (CDR) of mouse origin, leading to a reshaped humanised antibody. The C regions are human Ck (L-chain) and human C gamma (especially C gamma 1) (H-chain). The FR regions of the L chain V region are derived from human subtype HSG1 (e.g. from human antibody RE1) and the FR regions of the H chain V region are derived from human subtype HSG1 (e.g. FR1-3 from human antibody HG3 and FR4 from human antibody HG5. The present c sequence represents a PCR primer used in an example from the present invention. The antibodies are used for the treatment of myeloma, c subcutaneously. The antibodies are used at 0.01-1000 (especially 5-100) mg/kg body weight. The humanised antibody has low antigenicity and is therefore effective therapeutically in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

The specification describes a reconstituted human antibody recognizing the peptide antigen HM1.24. This human antibody contains natural human framework regions modified by amino acid substitutions to provide homogeneity with a previously designed framework region (which may arise from a human or non-human source); and complementary determining regions (CDR) derived from a non-human anti-HM1.24 antibody. The reconstituted antibody is useful in the treatment of diseases in which the surface antigen HM1.24 is implicated such as myeloma. The present sequence is used in the creation of the antibodies of the invention
Reconstituted human antibody; peptide antigen HM1.24; framework region; complementary determining region; CDR; anti-HM1.24 antibody; myeloma; humanised antibody; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; aryl hydrocarbon nuclear transport, ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARWD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma;

The procure in the serious energy cleave RNA encoded by an arryl dydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a flee 2 gene. AAA1767 and AAA17661 to AAA17623 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18888 and AAA19086 to AAA19154 represent ribozywe sequences; AAA19155 to AAA19122 represent their corresponding target sequences; AAA19155 to AAA19125 represent their corresponding target sequences; AAA19155 to AAA19150 to AAA19155 to AAA19150 to AAA19155 to AAA19150 to AAA19155 to AAA19150 and AAA2186 represent ribozywe sequences; AAA19155 to AAA19150 and AAA2186 represent ribozywe sequences; AAA19155 to AAA2168 represent ribozywe sequences; AAA1865 to AAA2160 and AAA2186 to AAA2160 and AAA2330 to AAA2330, to AAA2330, to AAA2330 and AAA2330 to AAA2330, to AAA2330, represent ribozywe sequence for integrin subunit beta 3, and AAA23476 to AAA2330, AAA2331 to AAA2342 represent their corresponding target sequences. The ribozywe of the invention are used for modilating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, andichibroma of tubercous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber Sendu syndrome, and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3 integrin subunit beta-3 integrin subunit beta-3 integrin subunit beta-3 integrin subunit alpha-6, or integrin subunit beta-3 i
                                                                                                                                                                                                                                                                                                                                                                        Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes enzymatic nucleic acid molecules with RNA

Mcswiggen JA;

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically gene, an integrin subunit beta 3 gene, and AAA1168 to AAA1565 uch AAA1762 represent ribozyme sequences for Tie-2 gene. AAA16775 to AAA19154 represent ribozyme sequences for Tie-2, and AAA1986 to AAA1908 corresponding target sequences; AAA19155 to AAA19152 represent their corresponding target sequences; AAA19153 to AAA21961 and AAA21955 represent ribozyme sequences for integrin alpha 6 subunit, and AAA2362 to AAA2150 and AAA2168 represent ribozyme sequences for integrin subunit beta 3, and AAA22476 to AAA2362 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA2342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA2343 are represent their corresponding target sequences. The ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA2343 are represent their corresponding target sequences. The ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA2343 are represent their corresponding target sequences. They are sepecially used to tract cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as especially used to tract cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, psoriasis, verruca vulgaris, and other syndrome, subunit alpha-6, or rice levels of ARMT, Tie-2, integrin subunit alpha-6, or the levels of ARMT, Tie-2, integrin subunit alpha-6, or the levels of ARMT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3

```
The invention relates to a nucleic acid molecule which down regulates expression of a cD20 gene and a nucleic acid molecule which down control and a control acid molecule which down control acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving RNA with an NTM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with an NCH with it presence of a divalent cation that is preferably MG<sup>2</sup>+. Corruptor, it may be contacted with a call to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-fluckamis HIV (human immunodeficiency virus) associated WHL, mantle-cell lymphoma (MCL), immunocytopaenia, and inflammatory arthropathy. The NOGO-targetting nucleic acid may be contacted with a cell lymphocytic lymphoma (MCL), immunocytopaenia, and inflammatory arthropathy. The NOGO targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the conclain and treat a patient having a condition associated with the level of the call and treat a patient having a condition associated with the level of condition associated with the level of the call and treat a patient having a condition associated with the level of the call and treat a patient having a condition associated with the level of the call and treat a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident creates which respond to the move of ore central particular, Hunington's disease, central well-and treat a patia
                                                                                                                                                                                                                                                                        Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GAPA transcription factor gene, IRR-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; noctropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NGG0; hammerhead ribozyme; DNAzyme; dlozo; neurite growth inhibitor gene; nyGG0; hammerhead ribozyme; bnazyme; dlozo; neurite growth inhibitor gene; lymphoma; lymphoma; lozozyme; lymphoma; lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVP, Alzheimer; s disease; multiple sclerosis; chemocherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; parkingon; disease; ataxia; Huntington's disease;

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retrinoblastoma, BRCA2, GFTR, cyclin-dependent Kinase inhibitor 2A (CDKNZA), APC, Factor VI, Factor VII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, applipoprotein E APOB1, LDL receptor (LDIR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APOC), presentiin-1 (PSENI) and presentiin-2 (PSENI). These can be used in the gene therapy of diseases Human; gene therapy, adenosine deaminase deficiency; p53; beta-globin, retinoblastoma, BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V, cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma, PBC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOB; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein B; LDLR; familial hypercholesterolaemia; UGTI; syndrome, APP; PSENI; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presenilin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic; Such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification. Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.

Claim 7; Page 189; 294pp; English.

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CTR, cyclin-dependent kinase inhibitor 2A (CDKWA2A), ARC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus apolipoprotein a (APOR). LDL receptor (LDLRA), wDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APOR), presentilin-1 (PSEN1) and presentilin-2 (PSRA2), These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophila, hyperchotesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatcous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting various syndromes. I oligonucleotides of

Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.

Claim 7; Page 189; 294pp; English.

The present invention provides single-stranded oligomucleotides which can be used for the targeted alteration of genomic sequences, where the coligomucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cetinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (DRN2A), APC, Pactor VIII, Factor IX, haemoglobin alpha locus (CDNN2A), APC, pator V, Factor VIII, Factor IX, haemoglobin alpha locus (UGTN1), amyloid precursor protein (APC), presentiln-1 (PSEM1) and presentiln-2 (PSEM2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, althemet's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to compare a simmunosquas to raise antibodies that specifically recognise hGDMLP-1 proteins or polypeptides may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be capture probes immunosquas to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionication, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed production.

The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                             Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a

The protein and polynucleotide sequences of hGDWLD-1 can be used in gene therapy and vaccine production. The hGDWLP-1 nucleic acids can be used as probes to detect, characterise and quantify
disorder associated with the expression of hGDMLP-1, in particular heart and skelletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. rhe sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         recognize hGDMLP-1 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule computure probes for surface-enhanced lassar desorption ionisation, as therefore probes for surface-enhanced lassar desorption ionisation, as the reapentic supplement in parients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymuclectide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart of and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig. wipo.int/pub/published_pct_sequence

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL chas two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL chares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The chart of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture disorder solved the state of the st

Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.

```
protein (HTPL, see ABV18759 to ABV18762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (s for short) compared to HTPL-I, (f for long). HTPL compared to the tructure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumouur suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL gene was usped to human chromosome 10712.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in the therapy and manufacture of a medicament for treatment or prevention of such disorders include disorders of testis, or adrenal, adult and therp. Such disorders include disorders of testis, or adrenal, adult and constant muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potential therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention

Novel isolated human testis expressed Patched like protein (HTPL), useful

```
The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL as two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL charges an overall structure organisation with the Patched protein. HTPL charced structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is the regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in thermal structure of a medicament for treatment or prevention of such disorders include disorders of testis, or adrenal, adult and the foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, selected liver, bone marrow, brain, kidney, lung, placenta, prostate, selected liver, bone marrow, brain, kidney, lung, placenta, prostate, selected muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for manile from the form.

The present invention relates to human testis expressed Patched like C protein (HTPL, see ABV78759 to ABV7876 and ABB9819 to ABB98520). HTPL protein (HTPL, see ABV78759 to ABV7876 and ABB9819 to ABB98520). HTPL concerns, with a few single base pair differences between the two. Once of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overal structural features strongly imply that HTPL lays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is mapped to human chromosome 10p12.1. HTPL and its coding sequence are cuseful for diagnosing a disorder caused by mutation in HTPL, and in cherpy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human form the standard marrow, brain, kidney, lung, placenta, prostate, concluding all diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
       Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

protein (HTPL, see ABV78759 to ABV78762 and ABB89819 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-8 (8 for short) compared to HTPL-L (1 for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The code important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome lopi2.1. HTPL and in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture disorders of testis, or adrenal, adult and foretal liver, bone marrow, brain, kidney, lung, placenta, prostate, colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention. The present invention relates to human testis expressed Patched like Sequence 17 BP; 2 A; 5 C; 4 G; 6 T; 0 U; 0 Other; Example 2; Page 228; 718pp; English.

The present invention relates to human testis expressed Patched like CC protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL CC has two isoforms, with a few single base pair differences between the two isoforms, with a few single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares atructural features strongly imply that HTPL plays a role similar ct to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL gene was consequent to ranged to human chromosome lopiz.1. HTPL, and is reading sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of the present disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and mucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligomucleotide was used in an example from the invention

Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.

```
The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, check and angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu cyndrome, leukaemia, osteoporosis and wound healing. (I) is useful for syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contexting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting (I) with ENG, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG ENA in a cell. (I) is useful for specifically carageting genes that share homology with ERG gene or ERG fundon genes. ABK7334-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and enzymatic nucleic acid molecules which regulate expression of ERG, and created enzymatic mucleic acid molecules which regulate expression of ERG, and created enzymatic mucleic acid molecules which regulate expression of ERG, and created enzymatic mucleic acid molecules which regulate expression of ERG, and created enzymatic molecules which regulate expression of E
                                                                                                                                                                                                                                                                                                                                                                                  Novel polynucleotide which down regulates expression of Ets-related gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                       useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, conditions selected from cancer, lymphoma, port-wine stains, Sturge weber syndrome, Rippel-Trenaunay-Weber syndrome, Osteoporosis and wound healing. (I) is useful for syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more theraphes the reatment is treated by administering (I) to the patient in angiogenesis is treated by administering (I) to the patient in a cell, by contacting (I) with (I). (I) is useful for reducing ERG activity in a cell, by contacting (I) with RMM, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to the presence of ERG RMA in a cell. (I) is useful for specifically such an anticent and mutations within diseased cells or to detect the presence of ERG RMA in a cell. (I) is useful for specifically such and the presence of ERG RMA in a cell. (I) is useful for specifically such and share homology with ERG gene or ERG fusion genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABKI7354-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, related PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0

The invention relates to a typing kit for judging human leukocyte antigen (HIA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HIA class I antigens on human genome and primers for amplification of cleaved nucleic acids relating to gene polymorphisms as alloantigens have been immobilised as polymorphisms. The method is useful for judging HIA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of pancreas, Langerhams islet in pancreas and cornea, susceptibility diancreas, Langerhams islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                                                                                                                                                                     Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide nucleic acid; PNA; nucleic acid zygosity; genetic analysis; scientific investigation; pharmacogenomic; pharmacogenetic; epigenomic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA P target DNA used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fiandaca MJ, Kristjanson MD, Hyldig-Nielsen JJ;

The present invention relates to combination oligomers, including block synthesis of combination of oligomers in the absence of a template. The invention relates to a composition comprising a polyworleobase strand and a combination oligomer comprising first and second oligomer blocks that are each independently a peptide nucleic acid (PNA) covalently linked to accombination oligomer comprising first acid second oligomer blocks that can each onledomer as a linker of at least three atoms in length, where the oligomer blocks are sequences specifically hybridised to a target oligomer sequence of contiguous nucleobases in the polymocleobase strand, to form a double stranded target sequence-oligomer complex. The composition is used for determining a target sequence of contiguous nucleobases and for determining the zygosity of a nucleic acid for a single nucleotide polymorphism (SNP). The methods are useful in scientific investigation, e.g., for detection, identification and/or enumeration of bacteria, or viruses and pathogens in food, beverages, water, pharmacentical products, viruses and pathogens in food, beverages, in clinical samples or in samples of plant, animal, human or environmental origin. They are also useful for menufacture or store food, beverages, water, pharmaceutical products, of personal care products dairy products or environmental samples. The methods and materials are useful in areas such as expression analysis, sometic analysis of humans, animals, therapy monitoring, pharmacogenetics, pharmacogenetics, capton of the invention ception of the invention 0 Composition for determining target sequence of contiguous nucleobases, comprises polynucleobase strand and combination oligomer comprising first and second oligomer blocks that are covalently linked to each other. The invention relates to a novel isolated 17 mer mucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive mucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence that conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, containing the vector cantibodies directed against the polypeptides are useful for propuration of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or call degeneration, specifically cancer but also Alzheimer's disease and diseases that are characterised by development of the 17 mer nucleic acids in patient samples is useful for disgnosis and/or prognosis of these companies. The polypeptides can also be used to generate antibodies, and diseases. The polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequence represents a tumour suppression chips. The nucleic acid sequence represents a tumour suppression chips. New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies Disclosure; Page 468; 720pp; French 06:29:55 2004 and transfected cells. ~ Tue Mar

The Invalidate describes an eurymeatic nucleic acid molecule (1) winton down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (1) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (1) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, corvical, head and neck, overian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of cher drug cervical, head and neck, overian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of cher drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methorizate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as condensed architis, restenosis, asthma, Crohn's disease such as chemotherapy applications, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury central nervous system (CNS) and mycoardial), glomerulonephritis, sequence repercion. The sequence represents an enzymatic nucleic acid used to modulate the function of a negrons of the enzymatic nucleic acid used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel enzymatic nucleic acid molecules which down regulates expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes an enzymatic nucleic acid molecule (I) which down
                     rheumatoid arthritis, restenosis, Crohn's disease, obesity, ischaemia, gene therapy, autoimmune disease, lupus, multiple sclerosis, sepsis, transplant/graft rejection, reperfusion injury, glomerulonephritis, allergic airway inflammation, inflammatory bowel disease, infection, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a sequence encoding a subunit of nuclear factor kappa B useful f
treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sub-unit

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NRKB), where (I) is an inozyme, Zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, corrical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug chemotherapy including paclitaxel, doctexael, cisplantin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, corrections are also useful for treating inflammatory disease such as cid molecules are also useful for treating inflammatory disease such as chammardial antibude corrections and antisense nucleic corrections are also useful for treating inflammatory disease such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  restenosis, asthma, Crohn's disease, diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          rheumatoid arthritis,

Sequence 17 BP; 4 A; 10 C; 2 G; 0 T; 1 U; 0 Other;

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

```

regulates expression of a sequence encoding a subunit of muclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oseophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug

The invention describes an enzymatic nucleic acid molecule (I) which down

```
Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                          ô
therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including pacilitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmume disease, lugus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischemaia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate.

regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an incayme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A, gene, in the presence of a divalent cation, especially MG<sup>2</sup>+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and nack, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, displatin, methorexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as
                                                             The invention describes an enzymatic nucleic acid molecule (I) which down

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 35; 72pp; English.

invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding subunit of nuclear factor. kappa B (NFKB), where (1) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multiplug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, displatin, methodrexate, cyclophosphanide, doxorubin, fluorouracil carboplatin, edatrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/traperfuaion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule Crohn's disease, diabetes rheumatoid arthritis, restenosis, asthma,

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is cancoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p21.3.0. MDZ4, MDZ3, MDZ4, MDZ1, e.g. cancer or developmental disorders. The nucleic associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ1, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids and also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ4; MDZ4; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer;

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ7, MDZ7, MDZ12. MDZ3 is concoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p1.2 and MDZ12 is encoded at chromosome 16p2.2 creating or preventing a disorder sasociated with decreased or increasing or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids and also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as theraputic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212, MD23 is encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p11.3 and MD212 is encoded at chromosome 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23. MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD21, genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.

```
The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HBR2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HBR2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ56889 - ABZ62216, ABZ6444 - ABZ65531, ABZ66520 - ABZ65214, ABZ65530 - ABZ65585 represent substrate/target sequences for the human

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ65216, ABZ64534 - ABZ65531, ABZ65520 - ABZ6524, ABZ65530 - ABZ65531, ABZ65531, ABZ65534 - ABZ65524
                                                                                                                                                                                                                                                                                                                                                                                                                Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HERS, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                  acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HERZ, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule are useful, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HERZ, K-Ras, H-Ras, and HIV acid molecules are useful for reducing also useful for recating breast, ovarian, colorectal, lung, prostate, also useful for cancer, and HIV in a cell. The nucleic acids are also useful for cancer, not Alzection, and Allo prostate, shown in Abz59889 - Abz65216, Abz64534 - Abz66531, Abz66520 - Abz66524, Abz66530 - Abz66531, Abz665310 - Abz66531, Abz665321, Abz66531, Ab

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, or are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well transcriptase and/or HBV reverse transcriptase primer sequences, as well by. The nucleic acids may be used to modulate the expression of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential for the treatment of degenerative and insease states related to HBV and HCV infection, replication and gene appression such as cirrhosis, liver failure, and hepstocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                             Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; therese transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus; HBV;

```
The present invention relates to nucleic acid molecules which modulate the synchesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes, inozymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis! liver failure, and hepatocellular carcinoma. The present sequence disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                      Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antiennse; enzymatic nucleic acid; hammerhead riboxyme; DNAzyme; inozyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state, HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, include antisense includes acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and/or represent a substrate for an expression and gene expression and as cirrhosis, liver failure, and hepatocallular carcinoma. The present sequence represents a substrate for one of the HBV compounds. Interpresents a substrate for one of the HBV compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistence. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip, in vitro as (anti)sense reagenes, and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies

                                                                                                                                                                                                                                                                     The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                     New nucleic acid comprising a mutation in LRP5 or LRP6, useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour supression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can be used to screen for their specific interactive molecules,

New human sodium-hydrogen exchanger like protein 1 (NFBLP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human NHELP1

Example 2; SEQ ID NO 52; 468pp; English

The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELP1). The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an attibody against the protein or its antigen-binding fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELP1. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 nanufacturing a protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELP1 gene (ADC03514).

Isolated APP clones were then injected into blastocysts, from the same species as the embryonic cells which contained the YAC library. Transgenic animals which could be used as models of beta-amyloidosis (prevalent in individuals with Down's syndrome and Alzhieimers disease), were then generated from the injected blastocysts. (Updated on 25-MAR-2003 to correct PN field.)

A new method has been developed of breeding for corn with increased kernel oil concentration. The method comprises: (a) selecting a corn plant from a breeding population using at least one of the genetic corners s1375, s1384, s1394, s1495, s1435, s1437, s1480, s1476, s1481, s1484, s1545, s1630, s1633, s1647, s1481, s1786, s1774, s1774, s1774, s1774, s1774, s1774, s1774, s1774, s1774, s1977, s1931, 
                                                                                                                                Breeding corn with increased oil concentration - comprises use of genetic markers to identify trait loci controlling kernel oil concentration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Mycobacterium kansasii specific DNA fragment (KATS2) useful for

Transfected cells, containing an HP4 prostaglandin receptor expression vector, can be used to screen for substances that bind to the HP4 receptor, for substances that inhibit ligand binding to the HP4 receptor, and for HP4 receptor agonists (based on increased cAMP production in cells pretreated with a phosphodiesterase inhibitor)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a PCR primer used in the amplification of human HP4 prostaglandin receptor. Transfected cells, containing an HP4 prostaglandin receptor expression vector, can be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         concentration; trait controlling loci; genetic marker; 3; PCR primer; ss.

```
designing oligonucleotides which are useful for detecting M. kansasii nucleic acid in clinical samples.
```

Claim 2; Page 11; 36pp; English

This sequence is a primer for a Mycobacterium kansasii KATS2 sequence of the invention. The KATS2 oligomucleotide is useful as a probe and a primer for detection of M. kansasii microvorgianisms or nucleic acids in veterinary and human clinical samples by hybridisation and amplification respectively. The KATS2 fragment was hybridized to genomic DNA from M. Kansasii and non-M. kansasii species, and was found to hybridise to all six M. kansasii strains tested, and none of the 17 non-M. kansasii strains. The new oligonucleotides allows rapid, accurate and sensitive identification of all strains of M. kansasii, compared to prior art probes which only identify 73 % of M. kansasii strains (e.g. ACCU-PROBE), or fail to detect one distinct M. kansasii subgroup (e.g. pMKL-9)

used to Identifying compounds which modulate expression of nucleic acids, provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity.

Example 21; Page 101; 264pp; English.

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA 

according to defined criteria. Also described are: (1) a method of defining a set of oligonuclectides (ONs) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation of synthetic compounds having defined physical, and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAY22701 to AAX52706, represent sequences used in the exemplification of the present invention 8888888888888888888

Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity.

Example 8; Page 77; 264pp; English.

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of

```
defining a set of oligonucleotides (ONS) that modulate the expression of a LNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, and AANYE2701 to AANZE2701 the AANZE2701 to AANZE2701 the exemplification of

This sequence represents an antisense inhibitor of the invention, and inhibits the expression of the human G-alpha-13 protein. The antisense compounds of the invention are of 8 to 30 nucleobases in length, that inhibits the expression of the human G-alpha-13. The antisense compound is useful for treating an animal, particularly humans, having or being prone to a disease or condition associated with the expression of G-alpha
G-alpha-13; human; inhibitor; cancer; antisense compound; therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense compound inhibiting expression of human G-alpha-13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 15; Col 39; 38pp; English.

The invention provides antisense compounds of 8-30 nucleotides that inhibit the expression of human Cellular Inhibitor of Apoptosis-2 (c-IAP-2). The antisense compounds may be used for diagnostics, therapeutics (for modulating the expression of C-IAP-2), prophylaxis (e.g. to prevent or delay infection, inflammation, or tumor formation), as research reagents (e.g. to distinguish between members of a biological pathway)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and in kits. Sequences AZZ22103-142 represent phosphorothioate oligonucleotides used for antisense inhibition of cellular inhibitor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense compounds complementary to Cellular Inhibitor of Apoptosis-2 useful for e.g. diagnostics, therapeutics, and as research reagents.

CD40 is involved in lymphocyte activation, tumour growth and/or angiogenesis. Inhibition of CD40 is used to treat or prevent immune-associated diseases (specifically guest vs. host disease, allograft rejection or autoimmune diseases); inflammation (specifically asthma, rheumatoid arthritis, allograft rejection, inflammatory bowel disease or psoriasis) on hyperproliferation (specifically cancer and rumours). the antisense oligonucleotides are also useful as diagnostic and research reagents. AAZ47762 represent them CD40 nucleotide sequence. AAZ47770 to AAZ47772 represent human CD40 nucleotide PCR primers, and a human CD40 PCR probe, respectively. AAZ47773 to AAZ47773 represent cher PCR primers and a probe used in the
anti-inflammatory; anti-arthritic; anti-asthmatic; antiproliferative; anti-order; immuno-exppressive; anti-psoriaritic; allograft rejection; hyperproliferative disease; autoimmune disease; rheumatoid arthritis; inflammatory bowel disease; asthma; psoriasis; cancer; tumour; ss.
                                                                                                                                                                                                                                                                                                                                                                                             Antisense molecules directed against nucleic acid encoding human CD40, for treating e.g. immune, inflammatory or hyperproliferative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human biallelic marker downstream amplification primer SEQ ID NO:9785.

invention, which contains polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N. B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Characterizing GC rich regions of a nucleic acid comprising modifying GC residues into residues complementary to A or T, and amplifying the modified product, useful for diagnosing trinucleotide repeats.
                                                                                                                                                                                                                                                                                                                                                                                     pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

                                                                        was used to amplify Fragile Xx Palated alleles from the FMRI gene. The invention relates to a method for characterising a GC rich region of a nucleic acid comprising contacting the nucleic acid with an agent that nucleic acid comprising contacting the nucleic acid with region of a nucleic acid with an agent that modifies C or G into residues complementary to A or T, amplifying (at least part of) the resultant modified nucleic acid, and determining the size of the amplification product. The methods and kits for carrying out the methods are useful for characterising GC rich nucleic acids. This is particularly useful for characterising GC rich nucleic acids. This is particularly useful for characterising GC rich nucleic acids. This is particularly useful for diagnosing trinucleotide repeats associated with Fragile Xx syndrome (FRAXA), spinal and bulbar muscular arrophy (SMBA), myotonic dystrophy (DM), Huntington's disease (HD), spinocerebellar ataxia type I (SCAI), fragile XX mental retardation (FRAXE-MR) and dentacoruntal pallidoluysian atrophy (DRAMA). Current methods of nucleic acid sequencing are hampered by the formation of stable secondary structures in GC rich regions which hamper the sequential incorporation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transformation of a cell with separate vectors expressing the sense and antisense strands of WAR-1 DNA for screening secretory and membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a screening method for secretory and membrane proteins consisting of transformation of a cell with separate expression vectors for the sense and antisense RNA of DNA encoding an endoplasmic reticulum membrane protein participating in endoplasmic

The present invention relates to an isolated DNA sequence encoding a insulin-like growth factor binding protein-3 (IGFBP-3) interacting protein, termed P4.33 protein. IGFBP-3 is used in gene therapy. Antibody specific for P4.33 protein in an assay for cancer treatment, prognosis, or diagnosis in a patient for cancer cells that express P4.33 protein or peptides, by determining the amount of P4.33 protein or peptides in a patient for cancer cells that express P4.33 protein or peptides, by determining the amount of P4.33 protein or peptides in utine, lymph, saliva, tumour tissue, placental tissue, umbilical cord tissue, amminotic fluid, chorionic villi tissue or their combinations, by enzyme linked immunosorbent assay (EJISA), Western canalysis, immunoprecipitation or immunohistocytochemistry. Detecting P4.33 specific sequences in a bodily fluid sample from a patient is also useful in an assay for cancer treatment, prognosis, or diagnosis in a performing a sequence identity assay such as ELISA immunologic assays, PCR assays, hybridisation assays and their combinations to detect P4.33-
reticulum transport of proteins. Also described are: (1) secretory and cell membrane proteins identified by the screening method; (2) drug compositions containing these proteins; (3) host cells transformed by the separate expression vectors of the merbad; and (4) the preparation of secretory and cell membrane proteins by culture of the transformants. The method can be used for the identification and preparation of proteins for use in the treament and prevention of diseases such as cancer, disorders of the nervous system, immune disorders (including allergies and rheumatism) and skeletal disorders (including allergies and prevent, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; insulin-like growth factor binding protein-3; IGFBP-3; cytostatic; lung; cervical; breast; colon; cancer; prostate carcinoma; P4.33 protein; gene therapy; cellular proliferation; apoptosis; receptor; antisense; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel insulin-like growth factor binding protein-3 interacting protein, termed P4.33 for identifying compounds having anti-cancer activity, inducing apoptosis and inhibiting cellular proliferation in cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human IGFBP-3 interacting protein, P4.33-specific antisense oligo #14.

the invention relates to an isolated polypeptide comprising a full length human prostaglandin (human placental clone number 4) HP4 receptor, where the amino acid sequence of the receptor is encoded by nucleotide sequence contained within an open reading frame of plasmid HS/HP4, American Type Culture Collection (ATCC) accession number 97472. Also included are a polypeptide comprising a fragment of HP4, where the fragment comprises an amino acid sequence encoded by 18 conscutive nucleotides of a nucleotide sequence region flamked by primers of appearing as ABK88470 and ABK88470 and the fragment binds an anti-HP4 antibody, and a composition comprising creceptor (which has prostaglandin HP2 receptor. The HP4 receptor (which has prostaglandin ED2 receptor pharmacological activity) is useful for determining the specific processes mediated by HP4 receptor and in replanting inflammation. HP4 is also useful for an in the development of treatments for bronchopulmonary inflammation can asthma, and in regulating inflammation. HP4 is also useful for in binding assays in particular for identifying HP4 receptor agonist and antagonist. The HP4 fragment is useful in in situ hybridisation and for
                                                                                                                                                                                                                           ô
specific sequences. P4.33 is useful for preventing or treating cancer, including lung, cervical, breast, colon or prostate carcinoma in a patient. P4.33 functions as a receptor for IGFBP-3 and is involved in the inhibition of DNA synthesis and cellular proliferation and in the induction of apoptosis in cancer cells. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New full length human prostaglandin human placental clone member 4 polypeptide useful in the development of treatments for bronchopulmonary inflammation and asthma, and for regulating inflammation.

generating antibodies against HP4 receptor epitopes that allows immunohisto-chemical localisation of the protein in cells, tissues, and body fluids, and thus identifying a cell expressing the HF4 receptor subtype. A composition comprising a fragment of HF4 polynuclectide is useful for decreasing or preventing translation of human HP4 prostaglandin receptor (i.e. antisense gene therapy). The present sequence is a reverse transcriptase (RT)-PCR primer used to amplify a region of the HF4 prostaglandin receptor mRNA corresponding to the second extracellular loop and seventh transmembrane domain

Treating a patient at risk for systemic inflammatory response syndrome e.g. trauma involves administering cyclooxygenase-2 inhibitor or a drug.

Example 5; Page 10; 39pp; English.

risk for systemic inflammatory response syndrome. The method involves administering a selective cyclooxygenase-2 inhibitor or a drug which stimulates at least one prostaglandin E 2 (PGE 2) receptor or a drug which interferes with binding of PGE 2 to at least one of PGE 2 receptors. The invention can be used for treating a patient at risk for systemic inflammatory response syndrome e.g. sepsis, pancreatitis, burns, trauma, life threatening blood loss from penetrating injury, or a patient who has undergen, septic shock, infections such as pneumonia, septicaemia, bacteraemia, urinary tract infection, wound infection or drug reaction and can also be used for beneficial immune modulation. The inhibitor or the drugs selectively modulate the immune response after trauma, reduce the incidence of infectious complications and improve The present invention relates to a new method of treating a patient at

The invention relates to a composition (I) comprising CDP-ME, 4—
diphosphocytidy1-2-C-methylerythricol synchase in crystalline form. The
invention also discloses screening for compounds (II) that inhibit the
non-mevalonate isopremoid biosynthesis pathway. (II) has antibacterial,
antidiarrheic, antiinflammatory and tuberculostatic activity. (II) is
cuseful for inhibiting in vitro or in vivo, the activity of one or more
enzymes in the non-mevalonate isopremoid biosynthesis pathway, in a cell
or cell-free environment, and thus modulating the growth of a cell e.g.
bacterial cell. (II) is also useful for inhibiting bacterial terpenoid
synthesis and treating a subject suffering from a bacterial infection
c.g. infection by Streptococcus or Escherichia coli. (II) is also useful
diarrhoea, pneumonia, dysentery, anthrax, rheumatic fever, toxic shock
syndrome, mastitis, meningitis, gonorrhea, typhoid fever,
cyastroenteritis, brucellosis, cholera, bubonic plague, tetanus,
tuberculosis and Lyme disease. The present sequence is that of a pcr

useful for attenuating the effects of endogenous HP4 receptor agonists in patients having conditions such as chronic asthma or immunosuppression, and for treating the above conditions. The present sequence represents a PCR primer for DNA encoding HP4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; EP prostaglandin receptor; human placental clone number 4; HP4; adenylate cyclase; chronic asthma; immunosuppression; antiasthmatic; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a gene encoding a novel human EP prostaglandin receptor, referred to as human placental clone number 4 (HP4). Also described is a vector, KS/HP4 (paluescript HP4 clone), used for the expression of HP4 in eukaryotic cells. The HP4 receptor, when expressed in eukaryotic cells, is capable of binding prostaglandins and to prostaglandins. The HP4 receptor is useful for studying the pharmacology, cellular distribution, and expression of the HP4 receptor. It is also useful as an antigen to raise antibodies against HP4 receptor epitopes, in binding assays for identifying HP4 receptor agonists and antagonists, and for sorrening compounds able to bind to the prostaglandin HP4 receptor. A composition comprising an antisense agent by the control of the HP4 receptor in vivo is inserting for prevent translation of the HP4 receptor in vivo is inserting for a prevent translation of the HP4 receptor in vivo is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated human prostaglandin HP4 receptor polypeptide encoded by plasmid KS/HP4, useful to stimulate adenylate cyclase activity in response to prostaglandins or to raise antibodies against HP4 receptor epitopes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primer #2 for DNA encoding human placental clone number 4 (HP4).

The present invention describes a method for determining the methylation status of CpG dinucleotides within the genes for oestrogen receptor, p21, p16, progesterone receptor, myoglobin, poins, cdc2, c-eraB2, p53 and/or CBA, which comprises contacting the target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides, and determining from the methylation status of the CpG positions the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA)-oligomers can be used as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNP) of a corresponding genomic DNA by analysis of a chemically pretreated genomic DNA. The pretreated genomic DNA is useful for the determination of the methylation status of a corresponding genomic DNA and/or detection of SNPs. The methods and pretreated genomic DNA are also useful for the characterisation, classification, diagnosis and differentiation of colon call profiterative disorders. This invention describes novel oligonuclectide probes used to detect contaminant bacteria that may be present in drinking water. The probes can detect bacteria (especially Legionella, faecal streptococci and coliforms) that may contaminate drinking water in environmental samples (water or soil), clinical samples (sputum, biopsies, urine etc.), in bathing and drinking water and in foods, pharmaceuticals and cosmetics, by in situ hybridisation. The probes combine the advantages of fluorescent in situ hybridisation with those of culture methods. Only a relatively short culture step is required, analysis takes 24-48 hours (contrast many days for conventional methods) and all relevant bacteria between species of the same genus and are easy to use, allowing simple between species of the same genus and are easy to use, allowing simple analysis of a large number of samples. The present invention describes a method for determining the methylation status of CpG dinucleotides within the genes for oestrogen receptor, p21, p27, p16, progesterone receptor, myoglobin, pona, cdc2, c-ers2, p53 and/or CEA, which comprises contacting the target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides, and determining from the methylation status of the CpG positions the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA) coligomers can be used as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNP) of a corresponding genomic DNA by analysis of a chemically pretreated genomic DNA. The pretreated genomic DNA is useful for the determination of the methylation status of a corresponding genomic DNA and/or detection of SNBs. The methods and pretreated genomic DNA are also useful for the characterisation, classification, diagnosis and differentiation of colon cell proliferative disorders. ACF62752 to ACF63278 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        . 0

The present invention relates to novel nucleic acids and proteins for accelactate synthase, ascelolactate synthase (MS) regulatory regions, alpha-tubulin promoter, polyketide synthase (PKS) promoter and fatty acid desaturase promoter from Thraustochytriales microorganisms. The nucleic microorganisms of the invention are useful for transforming Thraustochytriales microorganisms or the foreign nucleic acids in a Thraustochytriales present sequence is a primer which is used to detect the presence of prubszeoli. 2 sequences in Schizochytrium species. This sequence is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting and differentiating between colon cell proliferative disorders associated with a gene or its regulatory regions comprises contacting a target nucleic acid in a biological sample obtained from the subject with

The invention relates to a novel method for detecting and differentiating between colon cell proliferative disorders associated with at least one quene or its regulatory regions. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagents or a series of reagents, where the reagent or series of irreagents, distinguishes between methylated and non methylated CpG dinucleotides within the target nucleic acid. The molecules of the invention demonstrate cytostatic activity whilst the method may useful for detecting and differentiating between colon cell proliferative disorders, including cancers such as colon adenoma and colon carcinoma. The PNA (peptide nucleic acid)-oligomers are useful as probes for determining cytosine methylation state or single nucleotide polymorphisms. The current sequence is that of the kybridisation colinously concentration which was used to analyse the genomic
                                                                                                                                                                                                                                                                                                                                                                                                                .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel method for detecting and differentiating between lung cell proliferative disorders associated with at least one gene and/or their regulatory regions. Specifically, it refers to a method comprising contracting a target nucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated CpG dinucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR; primer, ss; lung cell proliferative disorder; CpG dinucleotide; adenocarcinoma; squamous cell carcinoma; cytostatic; probe; PNA-oligomer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting and differentiating cytosine methylation state of genomic DNA, useful for diagnosing, treating prognosticating and/or monitoring lung cell proliferative disorders e.g. adenocarcinoma and squamous cell carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer oligo used for analysing CpG islands in genomic DNA (SeqID 656).
                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

As such, it is possible to further differentiate and diagnose medical conditions including adenocarcinoma and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and PNA-oligomers that are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPS) of the target sequence. This oligomacleotide sequence is a primer oligomer used for the analysis of CpG positions within genomic DNA, used in an exemplification of the

                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nyce JW,
                                                                                                                                                                                                                                                        8866666688
```

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for the antial antiselement or prophylactic or therapeutic respiratory effect of an antialflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of sensitivity and sensitivity to adenosine, reducing levels of sensitivity and sensitivity and

Sequences shown in AAV55812 to AAV55827 represent primers used in the course of the invention for the multimerisation of minimal motifs. The invention provides a method for increasing the resistance of a core protein to proteily degradation that comprises linking or inserting onto or into the core protein a stabilising polypebtide of formula (Glya)X(Glyb)Y(Glyc)Zln where Glya, Glyb, Glyc are 1-6 sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, Phe, Pro or Thr and n can be anything between 1-66. X, X and Z need not be identical from n repeat to n repeat. Alternatively a nucleic acid encoding a stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the ufuses core protein. The products can be used for treating autoimmune diseases, cancer and inflammation. In particular, the core protein may be
                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New fusion proteins resistant to proteolytic degradation - comprising a core protein with a stabilising polypeptide comprising a peptide sequence
receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

```

```
an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein which can activate nitro drugs in enzyme/prodrug therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in diagnostic methods such as in vivo imaging. (Updated on 27-AUG-2003 to correct OS field.)

Claim 15; Page 15; 142pp; English.

The present invention relates to a new polymucleotide comprising a nucleotide sequence which comprises lipase, hormone sensitive (LIPE) isogenes. The invention is useful in screening for drugs targeting LIPE isogenes that are useful for treating obesity and male sterility. The isogenes that are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with LIPE activity. The polymucleotide is useful in studying the expression and function of LIPE, and in expressing LIPE protein for use in screening for candidate drugs to treat diseases related to LIPE activity. It is also useful in studying the effect of the variation on the biological activity of LIPE so the treatment of the binding affinity of candidate drugs targeting LIPE for the treatment of obserty and male sterility. The invention is useful for studying the expression of LIPE is accounted and testing of drugs targeted against LIPE protein, and for testing the efficacy of therapeutic agents and compounds for treating obesity and male sterility in a biological system. The present nucleic acid sequence represents one of a collection (ABK95568-ABK96025) of allele-specific oligonucleotide the human LIPE gene

WPI; 2002-636448/68.

Novel isolated polynucleotide which is a polymorphic variant of cytochrome P450, subfamily IIIA, polypeptide 5 (CYP3A5) gene useful for expressing CYP3A5 protein isoform used in drug screening techniques.

Claim 15; Page 15; 127pp; English.

The invention relates to isolated polynucleotide having cytochrome P450, subfamily IIIA, polypeptide 5 isogene (CYP3A5). The invention is useful for screening drugs. The invention is useful for studying expression and function of CYP3A5 and expression (CYP3A5) protein for use in screening for candidate drugs to treat diseases related to CYP3A5 activity. The polymorphism and haplotype data is useful for validating wherher CYP3A5 is a suitable target for drugs to treat drug metabolising disorders, screening for such drugs and reducing bias in clinical trials of such invention is also useful for therapeutic purposes. The invention is useful in studying the effect of variation on the biological activity of CYP3A5 as well as on the binding affinity of candidate drugs to crivity of CYP3A5 as well as on the binding affinity of candidate drugs to crivity of CYP3A5, or for studying the enzymatic properties of such CYP3A5 cor for studying the enzymatic properties of such CYP3A5 cor for studying the present sequence is human CYP3A5 gene useful in gene therapy. The present sequence is human CYP3A5 gene polymorphism detecting ASO (allele-specific oligonucleotide) primer

```
The present sequence is found in stem-loop structure 1 of a synthetic interleukin-2 repressor utron. It contains an 8 base ZIP sequence. Utrons are from or are from 10 years to, the 3' untranslated region (UTR), of an mRNA that stimulates or inhibits a cellular response by sequence specific interactions. Utrons are able to suppress constitutive and interferonce (IFN-gamma) induced major histocompatibility complex (MHC) class I and class II antigen expression and expression of other antigens, the gene promoters of which contain related sequence motifs that are stimulated by the same factors which stimulate MHC class I and class II antigen expression. The synthetic utron is designed to suppress activation of T lymphocytes caused by IL-2 and to result in generalised synthetic utron stimulates the effects of the drugs cyclosporin A and Synthetic utrons can be used to regalate gene expression in a subject, e.g. a human or a cell in vitro, specifically inhibiting MHC class I or II, ICAM-7, B7-1, B7-2, Fc gamma R, IL-2 or HIV gene expression. They can be used to inhibit transplant rejection, or treat an autoimmune or inflammatory disease or disorder
                                                                                                                                                                                                                                                                                                                                                                                                                        3' untranslated region, UTR; inhibition, gene expression, ICAM-7; interferon-gamma; IFN-gamma; major histocompatibility complex; MHC; antigen expression, gene promoter; utron, B7-1; B7-2; Fc gamma R; HIV gene expression, transplant rejection; treatment; cyclosporin; FK506; autoimmune disease; inflammatory disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Utrons, RNA molecules containing promoter regulatory motifs - useful to suppress expression from promoter of interest, specifically TSU nucleic acid suppression of MHC Class I and II gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.6%; Score 12.4; DB 1; Length 14; 92.9%; Pred. This sequence represents the boundary between intron 9 and exon 10 of the human Notch3 gene. Notch3 is a transmembrane receptor protein involved in lateral inhibition and regulating developmental cascades. of neurogenic genes. Mutated Notch3 proteins are thought to be involved in neurological disorders, especially of the cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASILI) type. Blocking expression of a mutated Notch3 gene or by substitution therapy with non-mutated Notch3 gene or protein can be used to treat CADASIL or related disorders. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human Notch3 nucleic acids - and methods for identifying pre-disposition to cerebral autosomal dominant arteriopathy with sub-cortical infarcts

The invention relates to a replicase complex comprising a hepatitis C virus (HCV) NS5B replicase protein, a linear nucleic acid template and a complementary nucleic acid primer which is annealed to the 3' terminus of the template, where the template is at least three nucleotides and the primer is two or three nucleotides, and the template and primer do not complex is useful for detecting NV replicase activity and permits establishment of sensitive RNA-dependent RNA polymerase assays to screen and evaluate antiviral inhibitors and to improve the specificity and efficacy of the inhibitors. The complex is also useful in the development of a reliable system for determining kinetic and thermodynamic constants of HCV NSSB-catalysed nucleotide incorporation and investigation of mechanistic inhibitors for mis-incorporation and investigation of Specifically, the short RNA template and primer pairs are useful in stream and mechanistic properties of NSSB replication and ultimately in the development of inhibitors of NSSB replication and ultimately in the development of inhibitors of NSSB newly identified inhibitors of replicase activity may be used for development and ultimately in the sequence ABEX99271-ABEX99296 represent HCV NSSB replicase RNA synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter. A shost cell comprising the promoter operably linked to a chereologous sequence, diagnosing opposing glaucoma in a sample containing a promoter region of the optineurin pene, associated with a glaucoma in a promoter region of the optineurin pene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing DNA, determining the presence or increased susceptibility to glaucoma or to a progressive ocular hypertensive clasoresting in loss of visual field in a patient (or the severity or progression of glaucoma or to a progressive ocular hypertensive clasoresion of glaucoma or to a progressive ocular hypertensive corpusation of glaucoma in a patient, comprising providing a mullification reaction primers that direct amplification of a selected mucleic acid region containing the variation within the optineurin promoter and amplifying the DNA) and detecting a polymorphism (comprising obtaining a sample containing human genomic DNA, providing a mucleic acid capable of detecting the DNA) and detecting a polymorphism (comprising progress and detecting the polymorphism). The invention is used to diagnose and progression is present sequence is an optineurin promoter motif, repeat element or present or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

                                                                                                                                                                                                                                                                                                                          The sequence is that of an oligonucleotide analogue, contg. internucleoside thioacetal linkages, which is capable of binding DNA or RNA. It is useful for therapeutic or diagnostic purposes, e.g. for treating cancer or viral or bacterial infections. It also has the ability to inhibit gene expression. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                         New modified oligomers contg. thio:acetal linkages - inhibit DNA and RNA expression, useful for treating viral diseases, malignancy, bacterial diseases and in diagnosis.

The EDTA probes 1-9 shown in sequences AAV28326-V28330 contain a single thymidine with EDTA covalently attached at C-5. The probes are used for specific recognition and cleavage of double-stranded DNA or RNA at a sequence specific loci using a triple helix intermediary. The method allows the delivery of chemotherapeutic agents in vivo an eliminates the need to denature the DNA before the agent can act. The method allows precise location of a chemotherapeutic agent or replacement gene sequence at a specific homopyrimidine-homopurine tract anywhere in a large doublestranded nucleic acid. This method allows diagnosis of gene based diseases, and eliminates the need for many steps in the commonly used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes pyrimidinone derivatives. These derivatives are used as labeled binding partners, particularly as labels for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

diagnostic, analytical and therapeutic applications. The derivatives are used as detectable labels for diagnostic assays, to enhance diagnostic assays that use oligonucleotides and to improve potency of oligonucleotides as antisense reagents that affect gene expression by altering intracellular metabolism of complementary RNA sequences encoding a target gene. They are also used in transfection complexes to deliver oligonucleotides into cell cytoplasm and in PCR e.g. as primers, and ingase chain reaction (LCR) e.g. as probes. The derivatives have increased affinity and specificity for their complementary sequences and facilitate PCR and LCR processes. The present sequence represents a

thrombopoietin receptor agonist antibodies - useful for treating unological or hematological disorders. WPI; 1999-204666/17. P-PSDB; AAY06707

Claim 10; Page 81; 86pp; English.

immunological

The invention relates to an agonist antibody (Ab) which binds to a thrombopoietin receptor (TPO-R). The antibodies which bind the TPO-R can be used in the same way and for the same indications as thrombopoietin (TPO). They can stimulate proliferation, differentiation or growth of megakaryocytes. They may also be able to stimulate megakaryocytes to increase platelet production. They can be used for treating immunological or hematopoietic disorders, especially thrombocytopenia. Thrombocytopenia rassociated bone marrow hypoplasia (e.g. aplastic anemia following chemotherapy or bone marrow transplant) may be effectively treated with the antibody compounds as well as disorders such as disseminated intravascular coagulation (DIC), immune thrombocytopenia (HIV-induced and intravascular coagulation (DIC), immune thrombocytopenia

thrombocytopenia, thrombotic thrombocytopenia and myelodysplasia. They can also be used in e.g. myelotoxic chemotherapy for treatment of solid tumours or leukaemia, myelotoxic chemotherapy for autologous or allogeneic bone marrow transplant, engelodysplasia, idiopathic aplastic anemia, congenital thrombocytopenia, and immune thrombocytopenia. The antibodies which bind to the MuSK receptor can be used for improving neuromuscular function in a patient, e.g. in muscular dystrophy. The products can also be used for detection and diagnosis. The antibodies have a longer half-life than the natural ligand for the TPO-R. Sequences AAX12387-X23413 represent DNA fragments encoding the CDR1, CDR2, and CDR3 regions of variable heavy (VH) chains and variable light (VL) chains of non HIV-induced), chronic idiopathic thrombocytopenia, 8×335555555555555888

Novel ribozymes for the treatment of diseases and conditions related to hepatitis  ${\tt C}$  infection.

Claim 1; Page 50; 123pp; English.

enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or The present sequence represents the preferred target sequence of an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, varts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present invention relates to a method for ameliorating the effects of

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 7; Page 53; 201pp; English

The present invention relates to a method for ameliorating the effects of askin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBB]-2 or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AMF4151 and AMF45153-6150mt). The method is useful for ameliorating the effects of psoriasis, inchthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperprolection of the inside of blood vessels or any other hyperplasia AAF47946

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation. 

Example 8; Page 63; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] - or IGFBP3, which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAPF5151 and AAF5153-FA5161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, heoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition ouch as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia

skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see APF45151 and AAF45153-F5161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, planis, serbornhoea, keloids, keratosis, neoplasias, soleroderma, warts, benign growths, cancers of the skin, a hoppeneovscular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperploiferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
